Database of Illinois Lepidoptera
Phase II

INTRODUCTION

Approximately 2000 species of Lepidoptera occur in Illinois. Because this group of organisms is closely monitored by ecologists and managers associated with private and State natural areas, it is important that its historical data be organized and accessible so that prudent management policies can be implemented. However, the historical data are widely scattered throughout the numerous institutional and private Lepidoptera collections within Illinois and other states. Therefore, it was deemed necessary to identify and locate these data and to develop a responsive database.

This report presents the results of collecting the data from 26 institutional and private collections that contain Illinois Lepidoptera (see Appendix A - Collections Surveyed) and of developing the database. The database includes five separate interrelated files using dBase Three Plus for data management and R & R Relational Report Writer to generate reports. These five interrelated files are as follows:

1. Species Names (HODGLIST) - listed by a unique number (following R. W. Hodges (1983) Checklist of the Lepidoptera of America North of Mexico) including family, subfamily, genus, species, subspecies, author, year, common name, state status, and federal status.

2. Localities (PLACES) - including site number (a unique assigned four-letter code), locality, county, township, section, meridian, and description. (See Appendix B - Localities by County for a listing of the included localities.)

3. Specimen Data (INPUTSUM) - data file containing individual data for each specimen: record number; Hodges number; date collected by day, month, and year; locale, site number, state, county, township, range, section, and meridian; life stage (egg, larva, pupa, adult); host plant; and comments.
4. Collectors (COLLECTR) - list of the collectors by name and assigned unique collector code of four letters.

5. Collections (COLLECTN) - list of the private and institutional collections surveyed including a unique assigned four-letter code for each collection, address, and comments.

Emphasis was on the Lymantriidae, Notodontidae, Saturniidae, and Sphingidae to facilitate the development of the database. These families were selected because they include several economically and ecologically important species and are well understood systematically. The results are checklists and collated geographical, temporal, and host plant data for the species of the four-named families within Illinois. Geographical distributional data may be retrieved at the county, township/range, section, and defined locality levels. For the purpose of this report, a statewide species checklist and county checklists for each family are presented (See State Checklist of Species and County Checklists of Species). The State Checklist of Species contains recommendations that particular species be placed on the State's Watchlist in either the W1 or W2 status. The report entitled Species Distribution by County shows in which counties the species have been recorded. The reports, County Checklists of Species and Species Distribution, by County reflect biases of collectors' tendencies; and can be used to determine where future collections and survey work is needed.

The temporal and host plant data are given as a statewide composite of all developmental stages (eggs, larvae, pupae, and adults) (See Summary of Occurrences and Host Plants). These data may be used to help determine the species' phenologies. Host plant information associated with the adult and pupal stages implies that they were reared from a larva on that host plant.

Data from other Lepidoptera families were gathered as they became available. Records for the species from the non-target families are incomplete and therefore not
included in this report. The Illinois Lepidoptera Database can accommodate additional information and in time will furnish more complete distributional and phenological data on all species.

The database includes 12,084 records obtained by 886 collectors between 1873 - 1990 from 731 localities. Sixteen collaborators helped with the development of this database by making their collections available and contributing data from them.

1A dubious state record. *Citheronia sepulcralis* apparently was reared in Normal, McLean County, where there are no native *Pinus* species prior to the relocation of the Illinois Natural History Survey to Urbana in 1885.
